

Danil Matvienko

Media Artist / Developer/
Producer /

Lives and works: Tbilisi, Georgia

The main tools of the work:
Unity, UE, TouchDesigner, Figma, video
Ai.

Additional tools:
Unreal engine, Photoshop, Cinema4D,
Substance painter, Davinci resolve ,
Resolume, Bitwig.

WORK EXPERIENCE

“ETO”
Studio development of AR / VR / Web /
Mobile applications games and
multimedia installation.

2021-2025

- management of a technical and creative team of 5-15 people
- maintaining the technical part of the project at all stages of production, from planning to release
- recruitment of employees
- communication with outsourcing teams

“Artnovi”
Art and technology Creative studio.

2023-2024

- C# / Unity Development
- Event installation
- Programing robots
- Assembly of electronic components for robots

“Planetarium 1”
Art and technology Creative studio.

2019 - 2023

- C# / Unity/ Touchdesigner development stands and multimedia installation.
- Development of multimedia installations
- Video engineering

Technical lead /
Art Director

C# Developer/
Technical Artist

Unity /
Touchdesigner
developer and
technical artist

Education

2020 – New Media Laboratory, New Stage of Alexandrinsky Theatre, Saint Petersburg

2019 – Workshop by Alexander Klygach: Real-time Control of Industrial Manipulators, Saint Petersburg

2023 – AI in Animation course

2022 – Base of Using Industrial Robots in Filmmaking, as part of New Media Art course, Sky University

2021 – Base of Using Industrial Robots in Multimedia Shows, as part of New Media Art course, Sky University

Additional Training

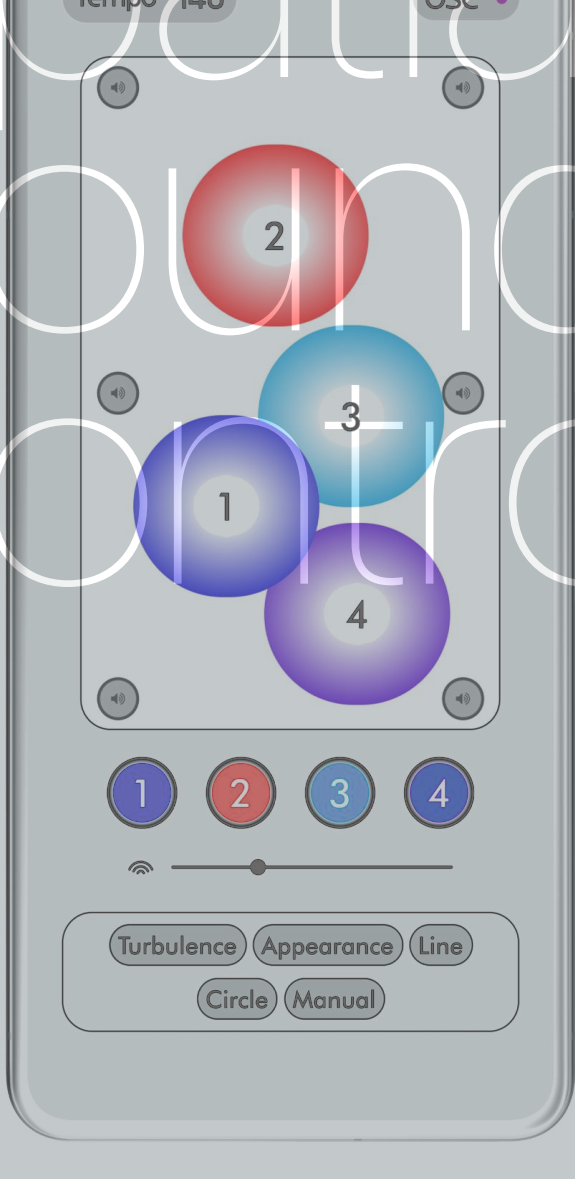

DEVELOPMENT

A minimalistic text brainteasers game, in which you need to write emotional messages and change state of shapes.

Emotion
in form

Sound
Control

OSC
Panoram

Which allows anyone anywhere in the world to get acquainted with their diploma collections. Getting into a new virtual world, you will find yourself at a crossroads.

Britanka gallery

A futuristic photo booth that places the user in the center of a real-time AI analysis. Using computer vision techniques and a language model (LLM API), the system generates a visual and textual profile of the user's “ideal profession” — with a playful, slightly surreal twist.

PROJECTS

Volumetric Audio-Visual Performance
Captured on a 6-channel spatial sound system with a massive subwoofer, rendered binaurally for immersive headphone listening.

Live visuals projected on a volumetric screen — a synesthetic experience of deep frequencies and generative light. Built around low-end energy, the set is designed to resonate with the body during live playback.

Dissolve

An audiovisual VR experience with hints of levitation and epilepsy. Relive the kidnapping of a man in a field. Burning, vibrating, floating.

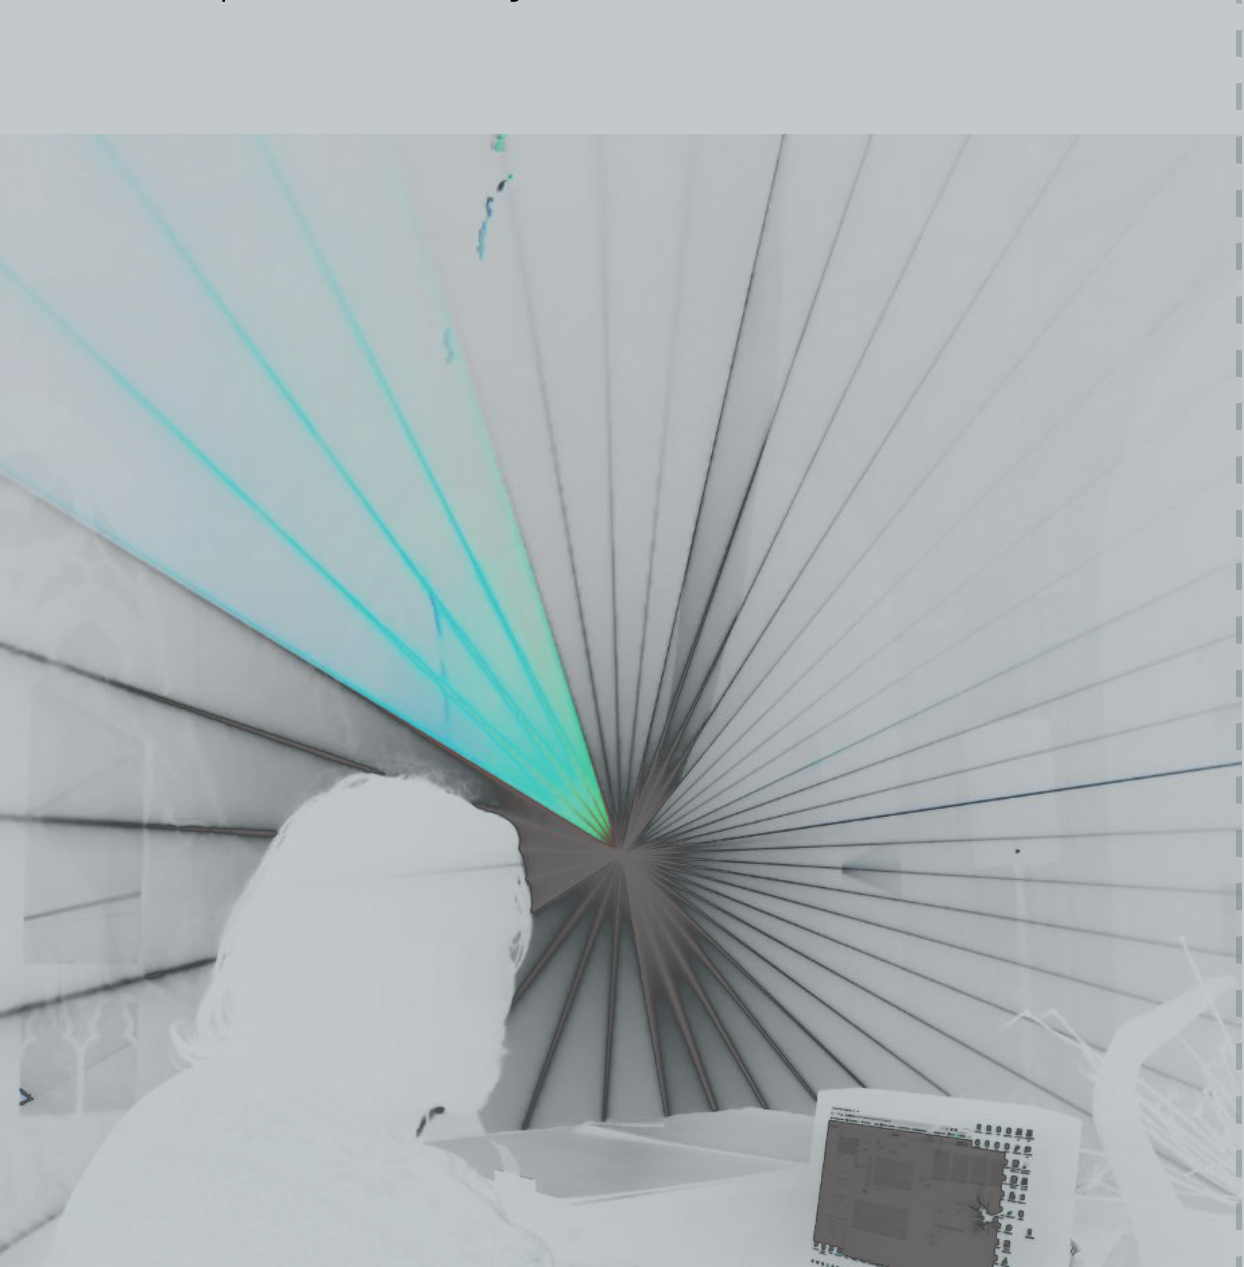

Field

Theatrical and scientific experiment with neurointerfaces. The sketch of the production was shown on the New Stage of the Alexandrinsky Theater, as well as on the new stage of the Yermolova Theater.

The Laboratory
of Pain

Theatrical and technological performance using neural networks, lasers and dynamic lighting effects. The neuro-spiritual session sends viewers back to the beginning of the Silver Age, when there were used the ideas of spiritualism and conversations with spirits. With the help of technology, the authors of the performance recreated this atmosphere today.

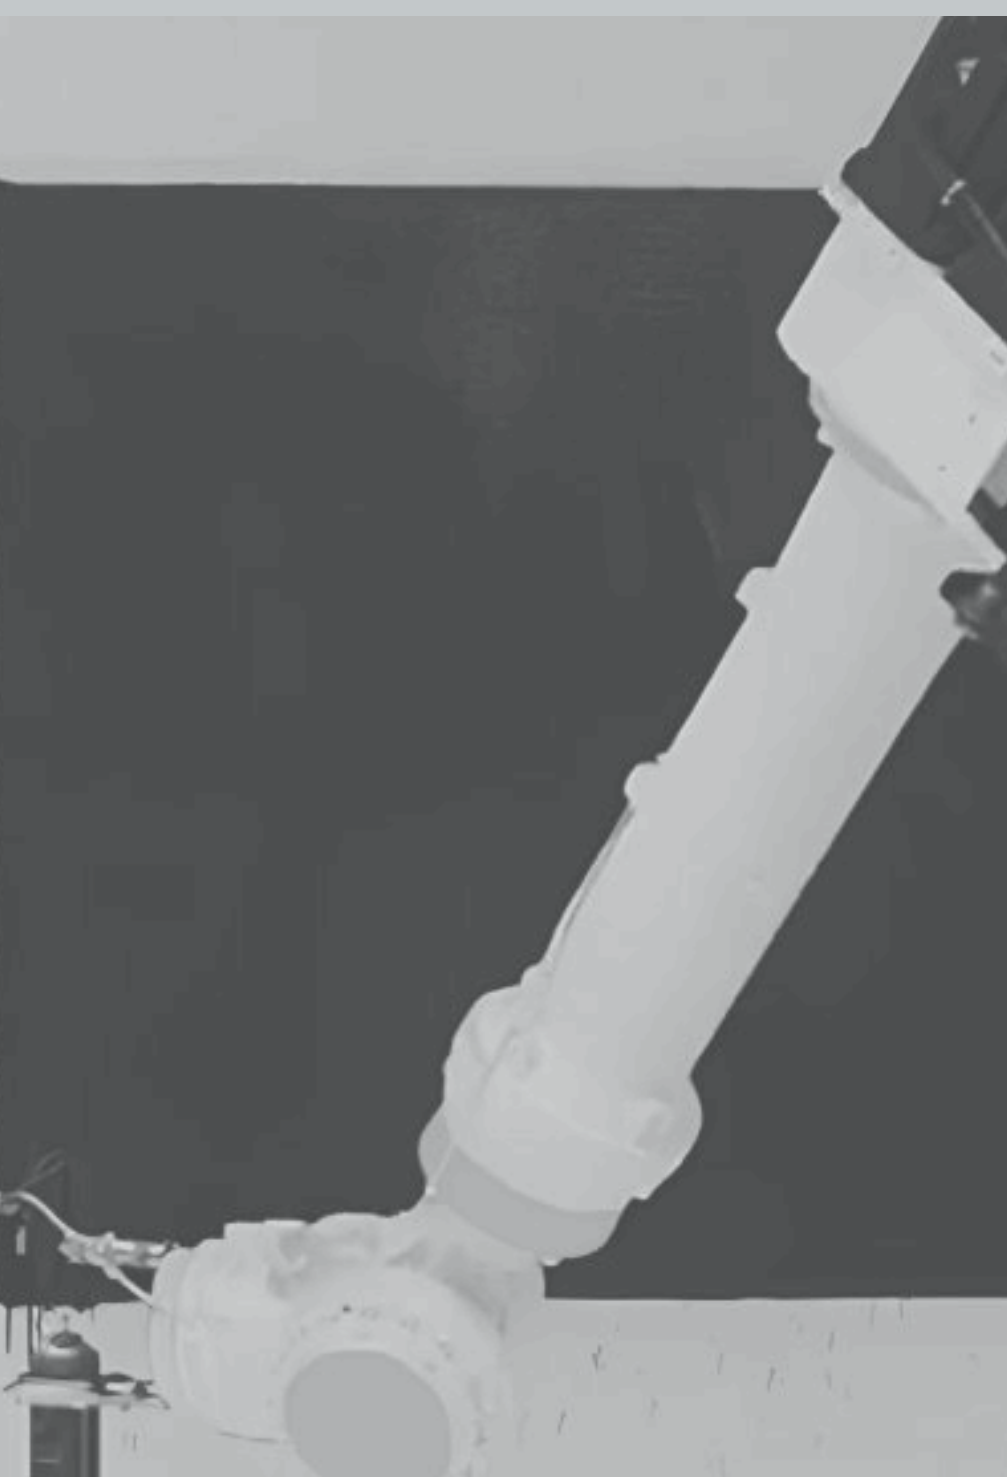

Seance

Drawing system created in collaboration with Sense and Misha Most.

The prototype of the post processor was written on touchdesigner.

In the full bundle of software, the final drawing is created in illustrator.

New absolute

robotic kinetic sound installation

The anthropomorphism of the industrial robotic arm is complemented by the archaic bird wing. The wing sticks out of the ground, alone large and strong.

Wing

The theatrical technological performance based on a 5-hour cycle of actions of three characters - a snake, a man and a typist. The action of the performance creates a space of timelessness and pushes the viewer into a reflective state on the theme of life and death, which are so closely intertwined.

Blood. Glass

Scenic experiment based on the play “The Seagull” by Anton Chekhov. The experiment used robots as actors and part of a creative team as well.
